

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

VI. *An Experiment concerning the nitrous Particles in the Air ; by the same Hand.*

— I Took a small Gally-pot, such as the Apothecaries in the North of *England* make use of, where I was when I made this Experiment, and ground the Top of it very smooth and true, and adapted thereto a Cover of blue Slate, which I had likewise ground with much Care. Into this Gally-pot I put equal Quantities of Nitre and Flour of Sulphur, about a Drachm of each. I then fixed on the Cover, putting it into a new Digester ; but the Height which I raised the Heat to, and how long I continued it, I do not exactly remember, but believe it was three or four Seconds. When I opened it the Day following, I perceived something had transpired betwixt the Top of the Gally-pot and the Cover ; the top Edges of the Gally-pot, where the Glazing was ground off, being discolour'd, though the Nitre and Sulphur were very little diminished as to their Weight ; only they were melted into one Lump, which I took out of the Gally-pot.

And having set the empty Gally-pot upon a Shelf, upon looking at it the next Day, I found long hoary Hairs, very bright and brittle, all around the ground Edges of the Pot, very specious to behold. After I had admired them a while, I gathered them, and, tasting them, found them to be pure Nitre. I then set the Pot upon the Shelf again, and in three or four Days, still finding there were fresh Shoots made, as large and specious as at the first, I gathered them a second and third time ; so that I suppose the
Pot

Pot would have continued to have shot fresh Nitre much longer, if I had not had urgent Use for it, to make other Experiments in. However, it is to be observed, that I had already gathered more Nitre than I put into the Pot at first; though, as I said before, for what I could perceive, I had taken all or near all the Nitre that I first put in together with the Sulphur, out of the Pot in a Lump. Hence we may have some Conceptions of the Nature of mineral Earths, and how they grow and increase, when once impregnated with the Seeds of a Mineral. This likewise is a Proof of the Quantity of nitrous Particles with which the Air abounds, since the large Quantity of Nitre which I collected out of the Pot, when left empty upon the Shelf, could be supplied by the Air only.

N. B. These three Experiments are all that I could save intire out of a great Number which were sent to the Hon. Mr. *Boyle*, in Answer to a Letter from him to Mr. *John Clayton*, containing 17 *Quære's*.

ROBERT CORKE.

VII. *Extract of a Letter from John Ratty, M. D. to Dr. Mortimer, Secr. R. S. concerning the Poison of Laurel-Water.*

Dear Doctor,

Dublin, May 17. 1732.

I Received thine of Feb. 15. with the *Transactions* N^o 418 and 420. giving an Account of the Experiments upon *Laurel-Water*. I wish your Experiments
